

Overheight pack detection in front of the pack discharge for packer Contipac

LCS machine upgrade
No. 0284

This upgrade improves the following

- Efficiency
- Environment
- Media
- Quality
- Personnel
- Material

Benefits of the upgrade

Quick detection of jams between machine and pack conveyor as well as prevention from damages by rising packs in the accumulated cluster

Suitable for the following machine types

All packers of type Contipac

Installation with minimum production loss

The conversion will be performed by one service engineer during one working day. Certainly, this measure can be scheduled for a non-production period.

The following improvements are achieved

- Damages at the machine equipment by rising cartons or crates of the cluster are prevented by a P.E. sensor mounted laterally at the machine discharge.
- The machine turns into the stop mode just before the packs may cause damages.
- The malfunction warning, which is transmitted by the P.E. sensor to the operator panel, supports a quick trouble shooting.
- Machine downtimes and thus unproductive periods of time are reduced.
